Title : The Effect of the Irradiation of Germanium with  $\alpha$  Particles on the Recombination of Current Carriers

Orig Pub : Chekhosl. fiz. zh., 1958, 8, No 2, 181-185

Abstract : An investigation was made of the influence of  $\alpha$ -particle irradiation on the surface recombination in a single crystal of n-Ge. The following are the data on a typical germanium specimen: specific electric resistivity at room temperature,  $0.22 \text{ ohm}^{-1}\text{-cm}^{-1}$ ; average lifetime for volume recombination, 35 microseconds; Hall constant  $1.23 \times 10^4 \text{ cm}^3\text{-coul}^{-1}$ , which corresponds to a carrier concentration at room temperature of  $5.8 \times 10^{14} \text{ cm}^{-3}$ . The source of  $\alpha$  particles was polonium with an activity of 0.740 millicurie. The irradiation was made in air at room temperature. In view of the small depth of penetration of the  $\alpha$  particles in

Abs Jour : Ref Zhur - Fizika, No 4, 1959, No 8598

germanium ( $1.9 \times 10^{-3}$  cm) it was proposed that the irradiation influences only the surface recombination of the excess carriers. The change in the lifetime during the time of irradiation was measured by the Meany method (Referat Zhur Fizika, 1955, No 11, 25227). The drop in the rate of recombination  $s$  observed at the beginning of the experiment is attributed to the influence of ozone on the surface of the germanium; the ozone is produced in the air under the influence of the  $\alpha$  particles. This conclusion was confirmed by control experiments, in which the enrichment of the atmosphere with ozone was attained by  $\alpha$  particles that did not strike the crystal, by discharges from a Tesla coil, and by illumination with mercury lamp. The relationship for  $s$ , proposed in the paper by Bardeen (Bardeen, J. International Colloquium in Semiconductors and Phosphors, Garmisch-Partenkirchen, 1956) was simplified and used to calculate the energy of activation of the recombination center,  $\epsilon_t$ , and the effective area of recombination  $qN_t$ . By investigating

Card : 2/3

CZECHOSLOV. KIA/Electricity - Semiconductors

G-3

Iss Jour : Ref Zhur - Fizika, No 4, 1959, No 8593

the temperature dependence of  $\tau$  before and after the irradiation it was found that  $sT$  depends little on the temperature, i.e.,  $\frac{dsT}{dT} \approx 0$ , from which it follows that the recombination centers are located near the conduction band or the main band. In this case  $qN_t = 5 \times 10^{-12} \text{ cm}^{-2}$  per single  $\gamma$  particle. The measurements made with other specimens of n-Ge the parameters of which are close in order of magnitude to those indicated above, give approximately the same results.

Title : Influence of Irradiation of Germanium by Alpha Particles  
on the Carrier Recombination.

Orig Pub : Ceskosl. casop. fys., 1958, 8, No 3, 326-330

Abstract : An investigation was made of the effect of  $\alpha$ -irradiation  
on the surface recombination in crystals of germanium.  
The irradiation was carried out in air. An approximate  
calculation has shown that the position of the energy level  
of the center of recombination, arising upon irradiation,  
lies near the upper edge of the valence band or near the lower  
edge of the conduction band. The effective recombination cross  
section was calculated and found to be approximately  $3 \times 10^{-12} \text{ cm}^2$ . -- I.P. Menbayeva

TITLE: Surface Properties of Germanium and Silicon

PERIODICAL: Československý časopis pro fysiku, 1960, Nr 2,  
pp 162 - 179

ABSTRACT: This is a review of the present state of the physics of surface phenomena on semiconductors, particularly germanium and silicon (94 refs). First, the physical model of the semiconductor surface is analysed on the basis of recent published experimental and theoretical work. Then the results are summarised of the study of pure surfaces of germanium and silicon and the changes in these properties as a result of adsorption of gases, particularly oxygen. Furthermore, experimentally obtained information is summarised on the gases and changes in the surface parameters of etched crystals. These parameters depend primarily on the state and the composition of the atmosphere surrounding the crystal. In Table 2 (p 175) experimental results are summarised on the factors characterising the "fast states". At the end of the paper results are summarised of the study

TITLE: Charge exchange mechanism between germanium and surface oxide 27

SOURCE: Chekhoslovatskiy fizicheskiy zhurnal, v. 15, no. 8, 1965, 581-594

TOPIC TAGS: transport process, charge transfer, diffusion, tunneling, electric field, surface process, semiconductor, relaxation, time dependence

ABSTRACT: The transport of charge carriers from germanium to the surface oxide is analyzed in detail by assuming the presence of field, tunnel, and diffusion mechanisms. In the first of the investigated cases, the hopping process from one oxide state to another, due to the presence of an electric field, led to a strongly exponential relaxation course. The tunnel transfer of excess electrons showed an exponential time dependence even in the general case of many values for the probability of such an effect. The time dependence was nonexponential in the diffusion of excess charges from the semiconductor to the oxide, and this latter mechanism is considered to be preponderant even though it is superposed over the field and tunneling effects, which also play a part. All of these transport mechanisms are taken into account 21,44,55
